Strategies to Improve Cardiac Arrest Survival

A Time to Act

National Academies Press **Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a**

community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. **Strategies to Improve Cardiac Arrest Survival** examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of **Strategies to Improve Cardiac Arrest Survival** provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Human Factors in Paramedic Practice

Class Professional Publishing Human factors is a scientific discipline which examines the interactions between components of a system, whilst aspiring to improve system performance and human well-being. Paramedics are often the first on scene in emergency and urgent situations, and the quality of care that patients receive is dependent on the performance of the paramedic, often working alone or as part of a small team and frequently in challenging environments. This book is an accessible and informative guide to the concepts of human factors and ergonomics in the field of paramedic practice. It shows how an understanding and application of these principles can improve paramedic performance and well-being, and ultimately patient care. The system components of paramedic practice consist of the patient, the environment, the equipment, the paramedic and their team, the organisation they work in and the wider culture. This book brings together a range of specialist contributors to consider each of these components in detail through chapters which explore situational awareness, human-centred design, the well-being of the paramedic, systems thinking and safety culture among other topics. It aims to provide paramedics with practical advice and the knowledge of human factors that they need to make their first contact with a patient in need as safe and effective as possible for all involved.

Paramedic Tutor This workbook was written with the intent of providing learners with an introduction to 12-15 Lead ECG Interpretation. The focus is on the acquisition and interpretation of ST segment myocardial infarction (STEMI) and other ECG changes in the acute setting. As a workbook, it is designed to assist you in reviewing the information covered in a 12 Lead interpretation course. However, what is new in the 4th edition is a series of QR Codes that link to video content related to the book. This makes it possible for the reader to learn ECGs without the added benefit of a course. This book is also ideal for educators who teach this subject. It's ideal because it's a workbook and is inexpensive for your students. Why have them pay for a full textbook when what you need is a textbook. Instructor slides are also available for purchases of 10 or more books. Topics covered in the book: Review of coronary anatomy
