Social and Communication Disorders Following Traumatic Brain Injury

[Psychology Press](#) Traumatic brain injury (TBI) can seriously disrupt the social and communication skills that are basic requirements for everyday life. It is the loss of these interpersonal skills that can be the most devastating for people with TBI and their families. Although there are many books that focus upon TBI, none focus on communication and communication skills specifically. This book fills this important gap in the literature and provides information ranging from a broad overview of the nature of pathology following TBI and its effects on cognition and behaviour, through to the latest evidence about ways to assess and treat social and communication disorders. Much has changed in the field of communication disorders and TBI since the first edition of this book was published in 1999. There have been advances in neuroimaging, providing more accurate understanding of how the brain is damaged in TBI and also insights into its repair. There has been a burgeoning interest in social cognition, and advances in how communication is conceptualized, with a particular focus on the role of how context facilitates or impedes communicative ability. Most importantly, much has changed in the arena of rehabilitation. There is now a growing evidence base of treatments aimed at improving communication problems following TBI, new resources for accessing this information and renewed interest in different kinds of methods for demonstrating treatment effects. Bringing together a range of expert international researchers interested in understanding the nature and treatment of TBI this book covers topics from understanding how the brain damage occurs, how it affects social and communication skills and how these problems might be treated. As such it will be of great interest to clinicians, postgraduate and undergraduate students and researchers in neuropsychology, speech and language pathology.

Cognitive Rehabilitation Therapy for Traumatic Brain Injury

Evaluating the Evidence

[National Academies Press](#) Traumatic brain injury (TBI) may affect 10 million people worldwide. It is considered the "signature wound" of the conflicts in Iraq and Afghanistan. These injuries result from a bump or blow to the head, or from external forces that cause the brain to move within the head, such as whiplash or exposure to blasts. TBI can cause an array of physical and mental health concerns and is a growing problem, particularly among soldiers and veterans because of repeated exposure to violent environments. One form of treatment for TBI is cognitive rehabilitation therapy (CRT), a patient-specific, goal-oriented approach to help patients increase their ability to process and interpret information. The Department of Defense asked the IOM to conduct a study to determine the effectiveness of CRT for treatment of TBI.

Primary Progressive Aphasia and Other Frontotemporal Dementias

Diagnosis and Treatment of Associated Communication Disorders

[Plural Publishing](#) Primary Progressive Aphasia and Other Frontotemporal Dementias: Diagnosis and Treatment of Associated Communication Disorders is the second volume in the "Medical Speech-Language Pathology" book series. It is intended to fill an unmet need to assist clinicians, students, and related healthcare professionals in the diagnosis and treatment of the title disorders. There is a growing population of individuals diagnosed with various forms of Frontotemporal Dementia (FTD) and Primary Progressive Aphasia (PPA), and this number is likely to increase as medical practitioners and speech-language pathologists (SLPs) become more expert at identifying these conditions. More clinicians will be seeing, and treating, patients with a diagnosis of FTD or PPA. Toward that end, the goal of this book is to expand this clinical knowledge base and support the development of skills in diagnosis, but also in clinical management. Within each chapter is a concise presentation of available evidence-based practice and research findings, with a focus on sharing information that is clinically applicable and digestible for non-researchers. Each chapter provides a comprehensive outline of testing that will assist in the diagnosis of the cognitive-communication disorders associated with FTD, PPAs, and primary progressive apraxia of speech (PPAOS). Disclaimer: Please note that ancillary content (such as documents, audio, and video, etc.) may not be included as published in the original print version of this book.
